I am currently trying to get the memory usage of my application, and it seems that in the ListView, it still calls Dispose even after the ItemsSource is cleared. Is there a way to avoid this behavior. and properly dispose of the ListView object? This is what I currently have: public static ListView CreateListView() { ListView lv = new ListView(); lv.ItemsSource = new List(); return lv; } I realize I could do the clean-up in the constructor, but my general question is if I can avoid this in the first place, and still get the performance benefits of the ListView. A: Are you using the default ListView items template? If not then the objects will be disposed when the ItemsSource is cleared. If that is the case then you are going to have to
